Track your Irrigation
Schedule and receive alerts
if anything goes wrong

OBSERVANTTM
A JAIN IRRIGATION COMPANY

Irrigation Scheduling Application

Operate your Irrigation system from anywhere

Observant's scheduling application helps you apply water when it's needed. Operating your valves and pumps remotely allows you to optimize your water usage and save money on labor costs, while having the peace of mind that you will be alerted immediately if anything goes wrong.

Irrigation Scheduling Application in Observant Global

The screenshot displays the Observant Global interface for scheduling irrigation. On the left, a configuration panel for 'Schedule South Fields' is visible, showing a start date of 'Thu 24 Sep 2020' at '9:00 AM', repeating every '1 Week', and running on 'S, M, T, W, T, F, S'. Below this, there are options to 'Preview Schedule Occurrences' and 'Hide Schedule Configuration'. A filter asset list shows 'A1 Outlet At Inj. Pump Station'. At the bottom left are 'Back' and 'Save' buttons. The main area is a satellite map with a 'Map' button and 'Locate' and 'Show roving only' options. Below the map is a timeline from 9:00 am to 1:00 pm. The timeline shows a blue bar for 'Pump Monitoring B4 Outlet At Inj. Pump Station' and four 'Pump And Valve Control' buttons. Below the timeline, there are options to 'Select to add a pump' and 'Select to add a sequence'.

- 1 Simple to use, **map based application** that works on any phone, tablet or desktop
- 2 Set overlapping run times for your **valves** so your **pump** can run continuously
- 3 **Automatically skips valves** if there is a fault detected so the pump is protected at all times
- 4 Set up your Irrigation Schedules once in the beginning of the season, and let the system **automate your day to day operations**
- 5 **Adjust your irrigation schedules any time**, as your crop and environmental conditions change
